RCS # RF-CHK3/5.
 MOTOR "NOISE" SUPPRESSION PCB.

This little PCB is placed in between the output of any brand of R/C throttle to help prevent electrical "Noise" from the motor(s) interfering with the signal reception. There are two ratings. **RF-CHK3** rated at 3 amps continuous. **RF-CHK5** rated at 5 amps continuous.

It is a simple screw in device that is advised if you are using RCS throttles with USA Trains® locos. The two little blue monolith capacitors go towards the motor.

It is recommended that you use one **RF-CHK** pcb per motor. If using the optional extra **ILC-3** cables please note they have been available in two colour combinations. Orange/Black/Grey and Brown/Purple/White.

The **RF-CHK** pcb is not a cure all and other forms of motor "noise" suppression may be needed as well. Contact RCS for advice.
